Attitudes: \*Teacher Evaluation

ABSTRACT

Part I of this report describes the attitudes of senior students toward course evaluation as measured on a thirty-seven item questionnaire. It shows that the students' response is related to the academic preparation they have received. In general students want evaluations to provide information to instructors concerning their courses and teaching. Part II assumes that student characteristics are related to student attitudes and that attitudes are related to responses on course evaluations. Evidence is presented that tends to support this assumption, but the author cautions against placing too much weight on this evidence. (Author)

#### ABSTRACT

This paper consists of two parts.

Part I describes the attitudes of senior students toward course evaluation as measured on a thirty-seven item questionnaire. It shows that the students' response is related to the academic preparation they have received. In general students want evaluations to provide information to instructors concerning their courses and teaching.

Part II assumes that student characteristics are related to student attitudes and that attitudes are related to responses on course evaluations. Evidence is presented which tends to support this assumption but the author cautions against placing too much weight on this evidence.

ATTITUDES OF SENIOR STUDENTS FROM A SMALL LIBERAL ARTS COLLEGE CONCERNING FACULTY AND COURSE EVALUATION:

SOME POSSIBLE EXPLANATIONS OF EVALUATION RESULTS

by
Gerald H. Lunney, The Centre College of Kentucky

Associated with the current pressure for accountability in education is the increasing popularity of the evaluation of instruction and courses by students. The use of evaluations of this nature in higher education has increased as a variety of forces have affected colleges and universities. Rating forms have been developed, or borrowed, or bought, and have been used for a variety of purposes on college campuses whose natures and purposes cover the spectrum of post-secondary education. However, little attention has been paid to the attitudes of students who complete the forms. Costin, Greenough, and Menges (1971) were unable to cite any research concerning student attitudes toward course evaluation in their review of the research on student ratings of college teaching and supplemented the review with their own brief assessment of student attitudes. Yet the student's attitude and perception of what he is doing when he rates a course or an instructor is of paramount importance to the evaluation process. As Remmers (1963) states:

...the measuring device is not the paper form but rather the individual rater....In addition to any limitations imposed by the form itself, ratings are limited by the characteristics of the human rater - his inevitably selective perception, memory, and forgetting, his lack of sensitivity to what may be psychologically and socially important, his inaccuracies of observation...

The current study was conducted in an attempt to focus attention on the importance of the attitudes with which students approach the rating of instruction and to provide data concerning this attitudes. The study is divided into two parts. The first represents a direct assessment of student attitudes. The second part considers four hypotheses which flow from Part I and provides evidence concerning these hypotheses.

#### Part I

#### Procedure:

On April 11, 1973, the entire senior class of Centre College was scheduled to participate in the college testing program. The Office of Institutional Research took this opportunity to survey these students' attitudes toward faculty and course evaluation. Only seniors were included in the survey for a variety of reasons, chief of which was the fact that they would not again be participating in the course evaluation program so participation in the survey would not bias the evaluation results. Because of illness or other emergencies, five students were absent from the scheduled testing session. The other 145 or 97% of the senior class was in attendance and completed the questionnaire.

The questionnaire consisted of 37 items each of which had three response categories. The responses were: Yes - if the item reflected the student's attitude; No - if the item did not reflect his attitude and? - if the student could not make up his mind. The students, although requested to complete all items, had the option to leave any item blank. The seniors were also asked to identify themselves according to sex and the division which included their major. Centre College has three divisions, Humanities, Social Studies and Sciences which roughly parallel the traditional liberal arts structure.

The first 36 items on the questionnaire were divided into four categories.

These were: 1) items concerning the student's right and ability to evaluate teaching (four items); 2) items concerning the student's objectivity in completing evaluation forms (nine items); 3) items concerning the procedures used in conducting the course evaluations (seven items), and; 4) items concerning the use to be made of the student responses. Item 37 asked the students' opinion concerning the contribution of course evaluations to the improvement of instruction.

### Insert Table 1 here

#### Results:

The overall results are presented in Table 1. The respondents generally felt that the evaluation of courses and instruction by students was a feasible procedure. Ninety-five per cent felt that they had the right to evaluate, 61% felt they knew enough about teaching and 57% felt they knew enough subject matter to adequately evaluate teaching effectiveness. The overall tenor of the responses concerning objectivity was that the students had been fair in their evaluations of courses and instruction. Concerning the mechanics of administering the course evaluations, there was ambivalence concerning the appropriate place in the term for the evaluations. This ambivalence is shared by the faculty and administration at Centre College. In general the respondents did not want personnel decisions to be heavily weighted on the results of student evaluations of instruction. This attitude applied consistently to faculty raises, prmotion and tenure. These results are consistent with the findings of Costin, Greenough, and Menges (1971). Concerning the question of whether course evaluations had contributed to the improvement of instruction, 46% responded yes and 41% responded no. The remaining 14% felt unqualified to respond, since they had no knowledge of the results of previous course evaluations.

In summary, the seniors felt that they could and did evaluate faculty fairly on the basis of valid criteria. At the same time, the students wanted the responses to go back to the instructor for his use in improving the course and instruction and did not want them to be weighted heavily for administrative decisions, concerning salary increases, promotion and tenure.

At the same time, there are great differences among seniors in their attitudes. The results of eighteen of the thirty-seven items distributed by

Insert Table 2 here

respondents' sex and the division which encompasses their major are shown in Table 2. These are the items for which there were great discrepancies between various subgroups in the students surveyed. Humanities students tended to respond in one of two ways. On several items they gave responses which represented idealistic views toward evaluations. On other items they gave "don't know" responses showing some hesitancy to commit themselves. Science students gave responses which showed a more pragmatic view toward course evaluation. Social studies students usually fell between these two positions. There is little difference between the attitudes of males and females except for two related items. Females have a greater desire to have evaluations early enough in the term to have an effect on the way the course is taught and are more strongly opposed to having the evaluation on the day of the final.

#### Implications:

One of the major responses to the pressure for accountability in postsecondary education is the creation of systems of course evaluation. Many institutions use the results of the evaluations for administrative personnel decisions decisions which will have a long term effect on higher education. It is, of

course, inappropriate to generalize from the results of one, small private liberal arts college. However, the results do seem to agree with those found at a large state university - at least in one department. More attention should be paid to what students think they are doing when they are evaluating courses and instruction. It is quite possible that students will respond differently when they are having an input concerning a professor's academic career than they will when they are informing him of their perceptions of his strengths and weaknesses as a teacher. Much effort and money have been expended to develop objective faculty and course evaluation techniques. If students complete evaluation with one purpose in mind only to have the results used for different ends, the resulting decisions are open to error.

. Care must be taken that an objective system of accountability not be discredited to the point of replacement by a system of hearsay and political maneuvering.

The other important implication is related to the fact that students differ in their attitudes toward course evaluation and that these differences can be related to demographic variables. In other words, a group of students responding to a course evaluation represent not one but several populations which have differing attitudes toward course evaluation. It is the purpose of Part II of this study to present preliminary evidence concerning the effect of tudes on student reponses to a course evaluation instrument.

#### Part II

#### Note:

In several respects, Part II of this study should not be reported, especially in as seemingly a statistical format as it is presented in this paper. First the data presented was not gathered as part of a research study

but as part of a course evaluation conducted at Centre College. In this respect, the data presented can be considered post hoc evidence since it was not gathered specifically to test the hypotheses which will be considered in this part of the paper. Of much greater importance, however, is this writer's contention that the data used to derive the tables in this section are not amenable to summarization or analysis using classical statistical procedures. There were 75 faculty members rated in 169 classes or 2.25 classes per faculty member. Also, 804 students completed 3,210 evaluation iorms in 169 classes or 3.99 evaluations per student. It is quite apparent that the 169 instructor scores and 169 course scores which are summarized in Tables 3 through 9 do not represent sets of 169 independent observations. What is probably the fundamental assumption of classical statistics is not met by these data. In the absence of appropriate statistical procedures, however, the summaries and analysis in this part of the paper are presented, not because they are right, but because they are useful in providing some evidence concerning the hypotheses under study. For this reason and because of the post hoc nature of these data only descriptive analyses are presented without application of any inference procedures. It is hoped that this presentation will motivate others to conduct research studies which will test the hypotheses about which only limited information can be presented in this report.

#### Hypotheses:

The findings in the first part of this paper seem to say that students (at least seniors) with differing academic orientations have different attitudes toward course evaluations. Logical extensions of this implication are the questions: Do students with differing attitudes toward course evaluation respond differently when the complete evaluation forms? Do students

with demonstrably different characteristics responded differently when they complete evaluation forms? The data available provides evidence concerning , four specific hypotheses related to these questions.

Hypothesis 1: Students with differing academic preparations have differing views of course evaluation and respond differently on evaluation forms.

Hypothesis 2: Students at differing levels of preparation respond differently on course evaluation forms.

Hypothesis 3: Student attitudes and responses vary as a function of the time of day when a class which they are evaluating is held.

Hypothesis 4: Student attitudes and responses are related to the size of the class which they are evaluating.

#### Procedure:

During the Fall Term, 1973, the Centre College Committee on Evaluation devised the form presented in Figure 1. The format was developed locally and the evaluation items, which came from a variety of sources, were revised

#### Insert Figure 1 here

to meet local needs. On the form, items 6 through 15 were identified as items concerning the instructor and items 16 through 24 were items concerning the course. Instead of having global items concerning the instructor and the course, overall ratings were derived by summing the item means for the instructor items, yielding a possible score of 50, and for the course items, yielding a possible score of 45. The evaluations were conducted in all classes. Computer summaries of the results and all student comments were reviewed by the Dean of the College and the Dean of Instruction before the results were returned to the individual instructor. Copies of the computer summaries were retained by the Office of Institutional Research and Evaluation for research

purposes. The results reported below represent some of the analyses of the data.

#### Results:

Evidence concerning the first and second hypotheses is presented in Tables 3 - 6. Table 3 contains percentile distributions for overall instructor

Insert Tables 3 and 4 here

scores with academic divisions reported separately by academic level. The three divisions of the College, Humanities, Social Studies, and Science and Mathematics are identified within three academic levels, Freshman, Sophomore and Junior/Senior. Juniors and Seniors are combined because at these levels courses are taken when offered and the distinction becomes blurred.

Table 4 presents the same data for instructors but with academic levels reported separately by division. In general Humanities instructors are rated highest while Science and Mathematics instructors are rated lowest. Freshman tend to rate instructors lowest while Juniors and Seniors rate them highest. The only exception to this is the distribution of Junior/Senior Social Studies scores which is lower than expected.

Table 5 contains percentile distributions for overall course scores with

Insert Tables 5 and 6 here

academic divisions reported separately by student level and Table 6 contains the percentile distributions for overall course scores with student levels reported separately by academic division. The results for overall course scores are generally consistent with the instructor scores, that is, Humanities highest, Science and Math lowest; Freshman lowest, Juniors and Seniors highest. For course scores, Junior/Senior Social Studies and Junior/Senior Science and

Math ratings are lower than expected.

Centre College uses a weekly schedule in which classes meet twice a week for a ninety minute period. Classes meet Monday-Thursday or Tuesday-Friday. There are four time blocks each day beginning at 8:30, 10:30, 12:30 and 2:30. Mean ratings by division and by academic level were computed for each time block for both overall instructor and overall course scores in order to provide evidence concerning the third hypothesis. Table 7 presents the distribution of overall instructor scores for division and Level across time blocks.

Insert Tables 7 and 8 here

Table 8 presents the distribution of overall course scores for division and level across time blocks. For both instructor and course ratings there does not seem to be a discernable pattern.

Finally, in order to present evidence concerning the fourth hypothesis,
Pearson Product Moment Correlation Coefficients were computed between class
size and overall instructor ratings and between class size and overall course

Insert Table 9 here

ratings for the various division-academic level combinations. The results are presented in Table 9. Here again no consistent pattern seems to be present and in no case is more than 21% of the variance in ratings explained by variance in class size. The fact that both positive and negative correlations are present is further evidence of inconsistency of results.

In summary, the evidence seems to support hypotheses 1 and 2, but does not seem to support hypotheses 3 and 4. The division of the course being rated and the academic level of the student doing the rating seem to be related to the ratings which an instructor and a course receive. At the same time,

the time of day during which a class is given and the size of the class do not seem to affect the ratings.

#### Implications:

As was stated previously, this study could not prove or disprove beyond doubt the existence of relationships between student attitudes and the way the students respond to evaluations of instruction and courses. Doubt should have been created, however, as to whether all students respond to evaluations in the same way.

Two recommendations arise from this study. First, there is need for research, with appropriate and adequate data, to determine the relationships between student attitudes and their responses to course evaluation. Second, until more is known concerning these relationships, comparative judgments of instructors and courses should be made only within small discipline by student level units. It seems most inappropriate to compare the ratings in Freshman science courses with the ratings in Senior literature or art courses.

		CENTRE INSTRUCTIONAL RATING FORM
Course		Date
Fill out i	this form by pla completed the fo	cing the appropriate letter in the blank before each statement. When orm, transfer your responses to the accompanying data card.
For each of situation		PART I ve questions, select the <u>one</u> response which <u>best</u> describes your
1.		ourse because it was (a) a graduation requirement; (b) a major program (c) a major program elective; (d) a general elective; (e) of interest
2,	For this cours (e) below C.	se, I expect to get a grade of (a) B+ or better; (b) B; (c) C+; (d) C;
3.		osent from this class (a) two or less times; (b) 3-5 times; (c) 6-10 -15 times; (e) over 15 times.
4.		s course with (a) great enthusiasm; (b) mild interest; (c) the attitude take the course; (d) apprehension about my ability to succeed; (e) a tude.
5,		a) greatly exceeded my expectations; (b) exceeded my expectations; (c) mons; (d) did not meet my expectations; (e) was nothing like what I expects
		PART II
Use the fo	ollowing code for	or Items 6-24
A - STRON	GLY AGREE	You strongly agree with this statement as it applies to this course or instructor.
B - AGREE		You agree more than you disagree with this statement as it applies to this course or instructor.
C - NEUTRA	AL _	You have neither a positive nor a negative response to this statement
D - DISAG	REE	as it applies to this course or instructor. You <u>disagree more than you agree</u> with this statement as it applies
E - STRON	GLY DISAGREE	to this course or instructor. You strongly disagree with this statement as it applies to this course
		or instructor.  y to the professor or course, put NA in the appropriate space on this ce for the item number on the data card.
	•	you wish in the space under the appropriate item.
6,	•	r seems to know the subject matter.
7.	The instructor	r uses class (lectures, lab, studio) time well.
8.	The instructor	r presents course material in an interesting way.
9.	The instructor	r's manner of presentation (voice, actions, etc.) assists learning.
		and the state of the control (over) and the state of the

	PART II (cont'd)
10.	The instructor senses when students are having difficulty with the material.
11.	The instructor encourages questions and spends adequate time answering them.
12.	The instructor grades fairly.
13.	The instructor conveys his interest in the subject matter.
14.	The instructor is available for extra help outside of class.
15.	The instructor respects students as persons.
16.	This course was organized in a manner which aided learning.
17.	The course emphasized understanding of the subject matter.
18.	The assignments contributed to the learning of the subject matter.
19.	The overall work load of the course was reasonable.
20,	I was given sufficient opportunities to show what I know about the subject.
21.	The instructor's objectives for this course have been fulfilled.
22.	This course has helped me improve my ability to think.
23.	This course has contributed to my intellectual development.
24.	This course has increased my interest in the subject.
General Co	omments concerning the course and the instruction.
